

Sometimes internet speed can affect loading of the interactive erosion map.

The colors and values on this static version of the map match the average values in the drop-down selections on Page 4 of the simulator and are based on 2007-2020 average erosion values by HUC 12 watershed collected by the Iowa State University Daily Erosion Project combined with 2020 average county land values to calculate the estimated value of an approximately 50% reduction in erosion generated by cover crops.
